

Data Tables and Management in Excel

(Organize, validate, and manage financial data in Excel)

Overview

This course uses an artifact sequence approach in which participants build a structured data workbook for tracking operational records such as transactions, settlements, or schedules. Each topic builds on the same artifact: organizing records into a named Table, applying date and intermediate formula layers, controlling data entry with validation, flagging exceptions through reconciliation and conditional formatting, and cleaning imported data using Excel's management tools.

Objectives

Upon completion of the course, participants will be able to organize, validate, and manage financial data in Excel using intermediate formulas, date functions, data validation, and data management tools.

Specifically, participants will be able to:

- organize data into a structured Table with named ranges and structured references
- calculate dates and deadlines using WORKDAY, NETWORKDAYS, EDATE, and TODAY
- apply VLOOKUP, nested IF, and SUMPRODUCT with cross-sheet lookups using INDIRECT
- control data entry using validation rules, dropdown lists, and formula-based constraints
- flag exceptions using COUNTIF, EXACT, and IFERROR with conditional formatting
- clean imported data using Remove Duplicates, Text to Columns, and Flash Fill

Who Should Participate

- Operations, finance, and administrative staff who manage, validate, or reconcile structured data in Excel.

Key Topics

- I. Structured Tables and Named Ranges
 - a. Converting raw data to a structured Table
 - b. Naming the Table and defining named ranges
 - c. Using structured references in formulas
 - d. Applying Table styles for visual clarity
- II. Financial Date Calculations
 - a. Calculating settlement dates using WORKDAY
 - b. Counting business days using NETWORKDAYS
 - c. Projecting maturity dates using EDATE
 - d. Flagging overdue settlements using TODAY
- III. Intermediate Formulas and Lookups
 - a. Applying VLOOKUP against a rate reference sheet
 - b. Classifying records with nested IF formulas
 - c. Calculating weighted values with SUMPRODUCT
 - d. Referencing across sheets using INDIRECT
- IV. Data Validation
 - a. Dropdown lists from named ranges
 - b. Numeric constraints on Face Value and Price
 - c. Formula-based validation for settlement dates
 - d. Input messages and error alerts
- V. Data Reconciliation and Conditional Formatting
 - a. Flagging duplicate ISINs with COUNTIF
 - b. Case-sensitive matching using EXACT
 - c. Handling missing references with IFERROR
 - d. Applying conditional formatting for exceptions
- VI. Data Management Tools
 - a. Removing duplicates from imported trade data
 - b. Splitting fields using Text to Columns
 - c. Cleaning patterns with Flash Fill
 - d. Multi-column sort and Subtotals by type
